New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensies, dene mapping, identification of mutations processing tresponsible for genetic disorders or other traits and to assess problematical to the processing tresponsible for genetic disorders or other traits and to assess processing to be a polypeptide (II) sequences. (I) is useful as hybridisation probes, or polypeptide (II) sequences. (I) is useful as hybridisation probes, or polypeptide (II) sequences. (I) is useful as hybridisation probes, or proposed to the sequence to the polymerase chain reaction (EVB) primers, olidomers, and for chromosome polymerase chain reaction (EVB) primers, olidomers, and for chromosome or for identifying expressed genes. (I) is useful in green therapy techniques of identifying expressed genes. (I) is useful in genes in the topyperpride in tissue, as molecular weight markers and as food supplement. (I.) and its binding partners are useful in receipting of a food supplement. (I.) and its binding partners are useful in receipting of a food supplement. (I.) and its binding partners are useful in receipting of disorders involving aberrant protein expression or biological activity. In produce and polymerical in the sequences have applied and polymerical in the printed diagnostics, lorensies, quee mapping, identification of mulations of and to produce other types of data and products dependent on DNA and diagnostics amino acid sequences of the invention. One of the printed of special call of the angle product acid sequences of the invention. In the printed of special or heart and to appear in the printed of special call of the p

The examples describe procedures for the designing of probes for hpG-CSF winh and genomic clones, both of which are claimed Specifically claimed are DNA sequences coding for (Ala 1)hpG-CSF; (Ser 36,42,64 and 74)hpG-CSF and the corresp. Met.1 cpds. The novelty is that hpG-CSF is the prod. of procaryotic or eucaryotic expression of an examples.

The present invention relates to novel single exon nucleic acid probes (see AAIGOOD-AAIGOOT). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gence expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, monitoring and prognosing diseases of the human breast, particularly those diseases with polymenic actiology. The diseases include: breast cancer, disorders of development inflammatory diseases of the breast, librocystic changes, proliferative breast disease and non-carrinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WHEO at the whop.int/published_pet_sequences.
                                                                                   inflammatory disease, proliferative breast disease, non carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel single exon nucleic acid probe used to measuring gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1360 SDSGDSTEVSRNVEETVVKTTSVFVDALPHVPEHRRLPTLVQCADTLGAERFTWITTLIL 1419
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide #3739 encoded by probe for measuring breast gene expression.

```
probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, lenkaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
discases such as Alzheimer's discase, multiple seletosis, sehizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                   1360 SDSGDSTEVSRNVEETVVKLISVEVDALPHVPEHRRLPILVQLVDTLGAEKFLMILLILL 1419
